## Wireless Local Area Network

- Growing fast network Technology
- Provide connectivity to computer to network over short network area

- use for short Range & small grp
- No Needs of cables

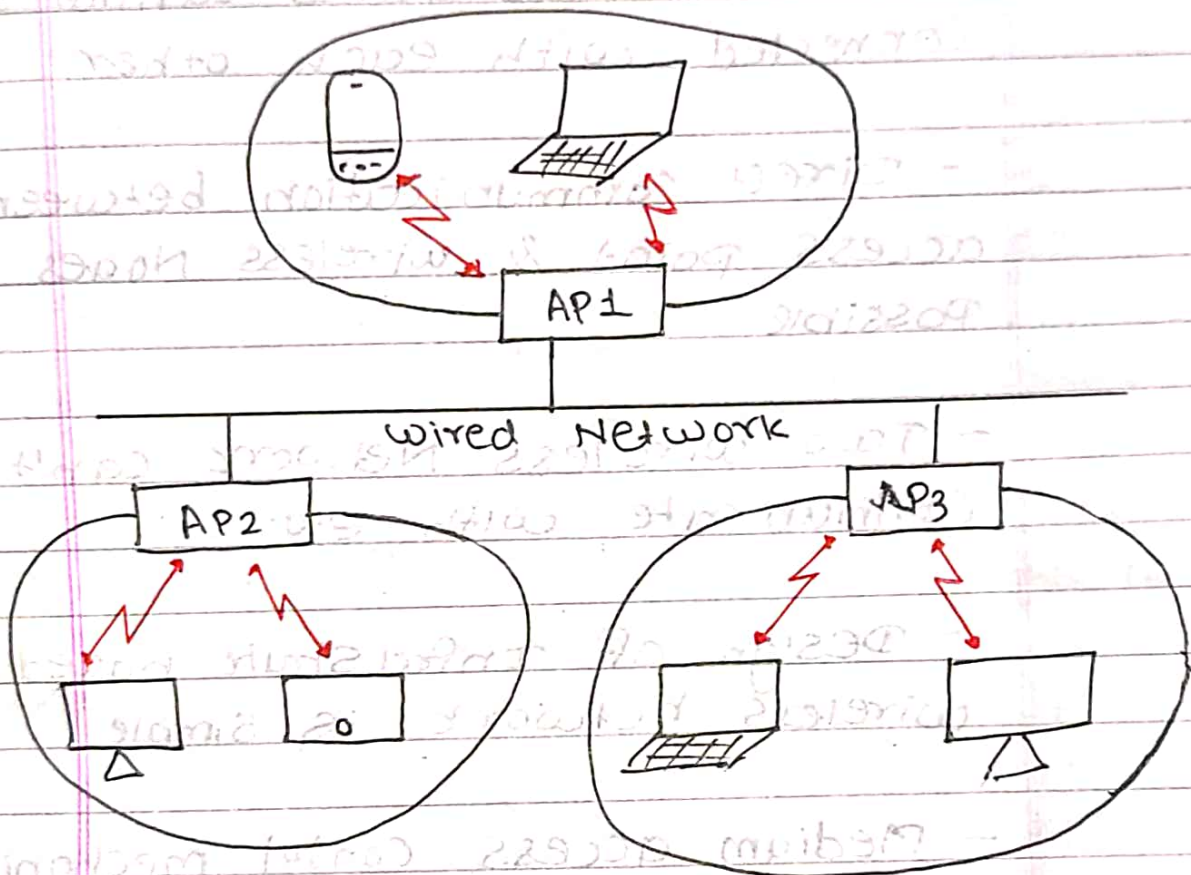

Advantages	DisAdvantages
<ul style="list-style-type: none"> <li>• Mobility</li> <li>• Low implemation cost</li> <li>• Instalation speed and Simplicity</li> <li>• Network expansion</li> <li>• Reliability</li> <li>• Scalability</li> </ul>	<ul style="list-style-type: none"> <li>• Quality of Network</li> <li>• Restrictions</li> <li>• Safety &amp; security</li> <li>• Proprietary soln</li> </ul>

- There are two types of WLAN.

- Infrastructure Network
- Ad hoc Network

### • Infrastructure Based WLAN

AP: Access point

- It control medium access & it act like bridge between the existing wireless network & other network.

- Access Point Provides internet to diff<sup>n</sup> - diff<sup>n</sup> devices
- All access Points are directly connected with each other
- Two wireless Nodes cannot be connected with each other
- Direct communication between access point & wireless Nodes is possible
- Two wireless Network can't communicate with e.o.
- Design of Infrastructure based wireless network is simple
- Medium access control mechanism is possible so that there is No Collusion.

Q. Explain how data packets will get transferred).

# Ad Hoc Network

- Doesn't Need any Infrastructure to work.
- It is a temporary Network
- Nodes will come in the network then communicate with each other then nodes can leave the Network
- No need of Access Point each node communicate with e.o. Simultaneously.
- In Ad hoc Network complexity of each network is higher.
- Nodes not Belongs to Same network can't communicate with each other.

Parameter	Infrastructure	Ad hoc
Access Point	Required	No AP
Hardware	Simple Design hardware	More complex design of hardware
Time require for setup	More	less
Flexibility	Less	More
Limitation on range	Larger range	Limited (smaller) range
Communication with others when not in range	Can be done via AP.	Not Possible

## • IEEE 802.11

- IEEE 802.11 is also known as wireless fidelity (wifi)
- Design to use limited geography area
- It is a WLAN technique.
- It supports 2 additional feature
  - Power management
  - Security mechanism

- Uses 5 GHz Band (High Freqs)
- It has 23 overlapping channels
- can also use 2.4 GHz with only 3 overlapping channels

#### • WiFi adapter

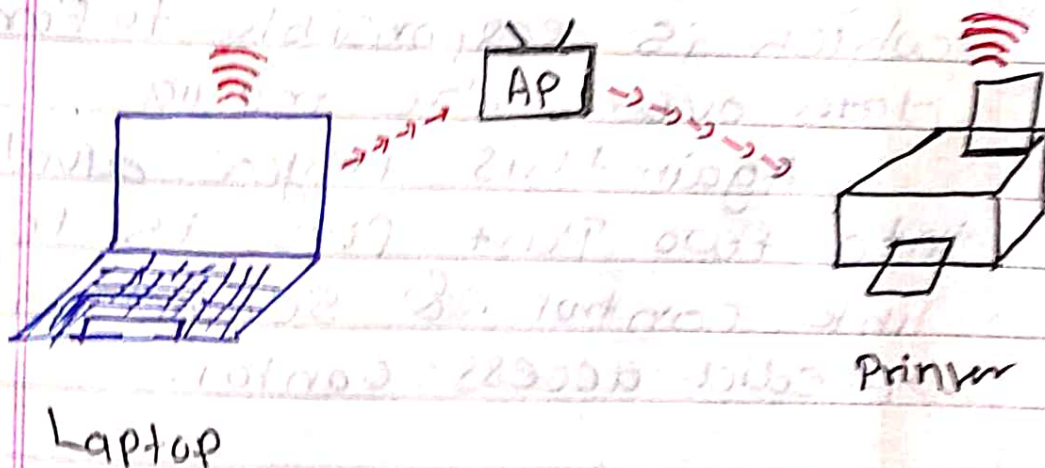

It is a small device that enables computer to connect other electronic device with the help of WiFi.

It is a type of NIC (Network interface controller)

#### • Modes

##### ① Infrastructure

## 2. Ad hoc & wifi direct

### IEEE 802.11 MAC Sublayer.

— Mac stands for medium access control.

— Tasks Performed by mac are.

- Control medium access
- Support roaming
- Authentication

The OSI model in total 7 Sublayer in which the second layer is Data link layer which is responsible to forward data over the media.

Again this layer divided into two Part first is logical link control & second is Media access control.

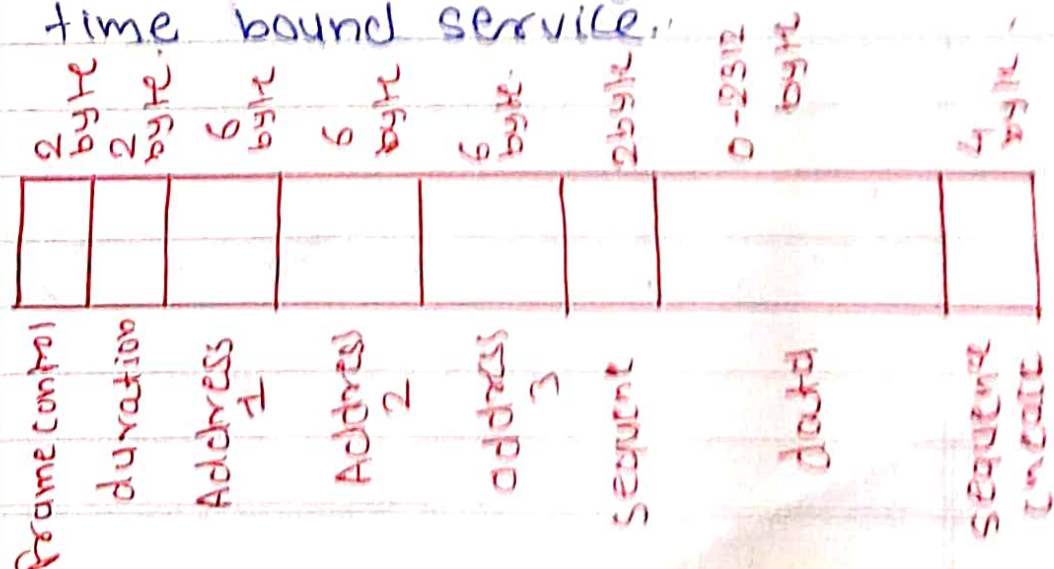

## Basic services of MAC

1. Asynchronous Data Service (Mandatory)
2. Time bounded service (Optional)

Here Ad hoc model offers only asynchronous data service whereas infrastructure model offer both time bounded & Asynchronous data service.

## Three basic access mechanisms.

1. Method Based on CSMA/CA  
Carrier sense multiple access / collision avoidance
2. Method to avoid hidden terminal Process.
3. Collision free polling method for time bound service.

- Synchronization
- Power management

## • Bluetooth

### What is Bluetooth

It is technology used to connect mobile with their peripheral.

It is an open standard that allows communication between diverse devices.

Bluetooth is a Wireless local area Network (WLAN) technology that we use to exchange data over smaller distance.

- It has limited coverage, can cover data between 10m approx.
- doesn't require any kind of infrastructure
- It is an example of Ad hoc network
- Compare to wifi it is slower and limited range
- It apply FHSS with 1600 hops hopping rate
- Communication speed is less than 1 Mbps.

## Advantages

- easy to use
- Low cost (Free)
- No need of infrastructure.
- Wireless technology
- No need of internet

## Disadvantage

- Low range
- Less speed for data transfer
- Security issue.

## • Bluetooth Protocol Stack

- |               |                 |
|---------------|-----------------|
| ① Piconet     | ② Scattered net |
| ③ master Unit | ④ Slave unit    |
| ⑤ Parked unit | ⑥ Standby unit  |

## Piconet

It is a network connected by multiple wireless device using Bluetooth.

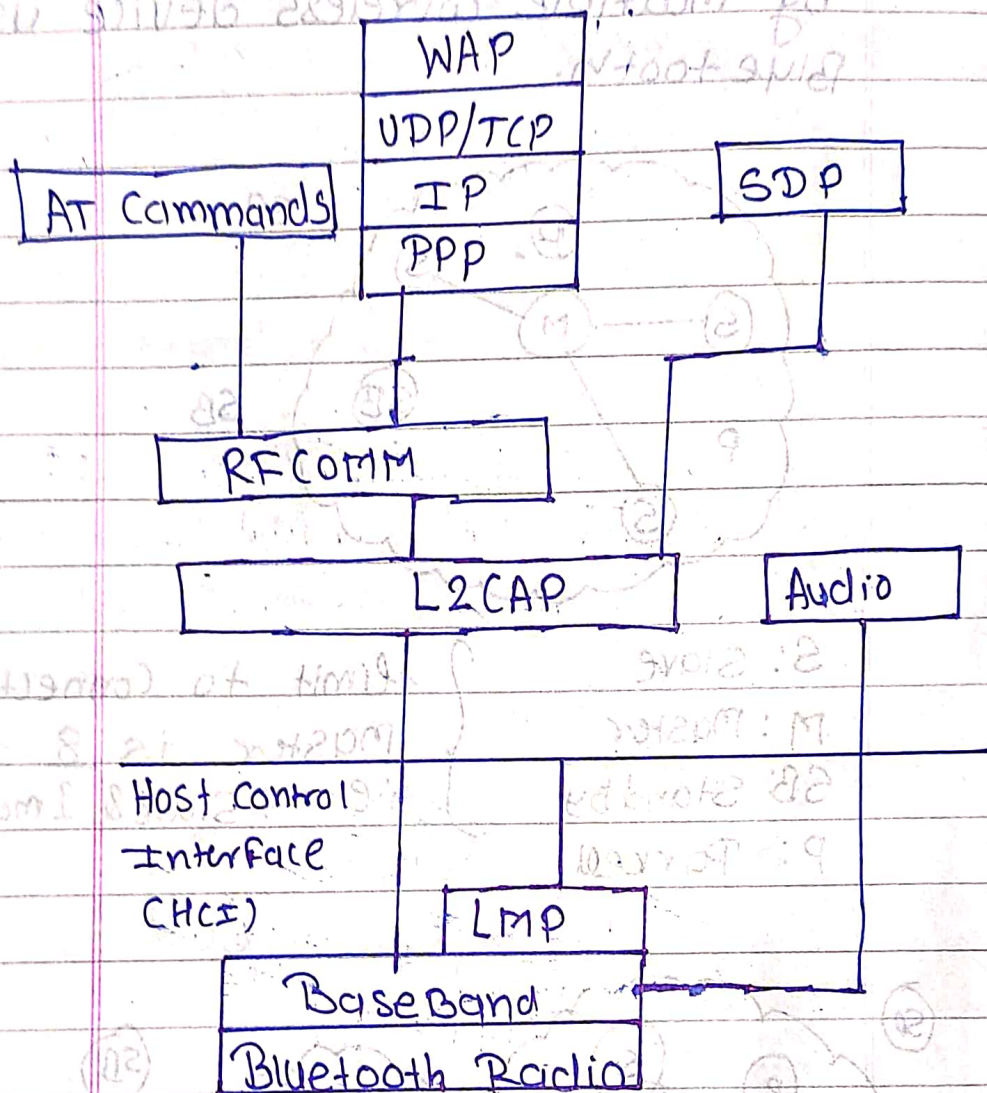

S: Slave  
M: Master  
SB: Standby  
P: Parked

limit to connect  
master is 8  
i.e. 7 Slave & 1 master

# • IEEE 802.15.1 (Bluetooth).

~~Bluetooth~~

Bluetooth Protocol Stack.

- Bluetooth Core Protocol:  
LMP, L2CAP, SDP
- Core replacement Protocol:  
RFComm
- Adopted Protocol  
PPP, UDP/TCP/IP, WAP

### Base Band:

It is a Physical layer of the bluetooth protocol stack.

It mainly manage Physical channels of bluetooth.

### LMP (Link Manage Protocol)

It identifies when 2 bluetooth devices comes in nearby

It helps to link 2 devices also helps to discover new devices

It manages Security also.

- L2CAP:

It Provide Connection oriented and Connection less data service to the upper layer protocol.

It is responsible for segmentation of large packets & multiplexing of bluetooth packets.

- SDP

Service discovery protocol

→ Responsible to join bluetooth device to Piconet

→ with help of SDP device enquire about service of mode

- Cable Replacement Protocol  
RFCOMM.

It is a Serial communication protocol Based on ETSI

It Provide reliable data stream multiple concurrent connections, Flow control & Serial link setting.

## • Architecture of WIMAX

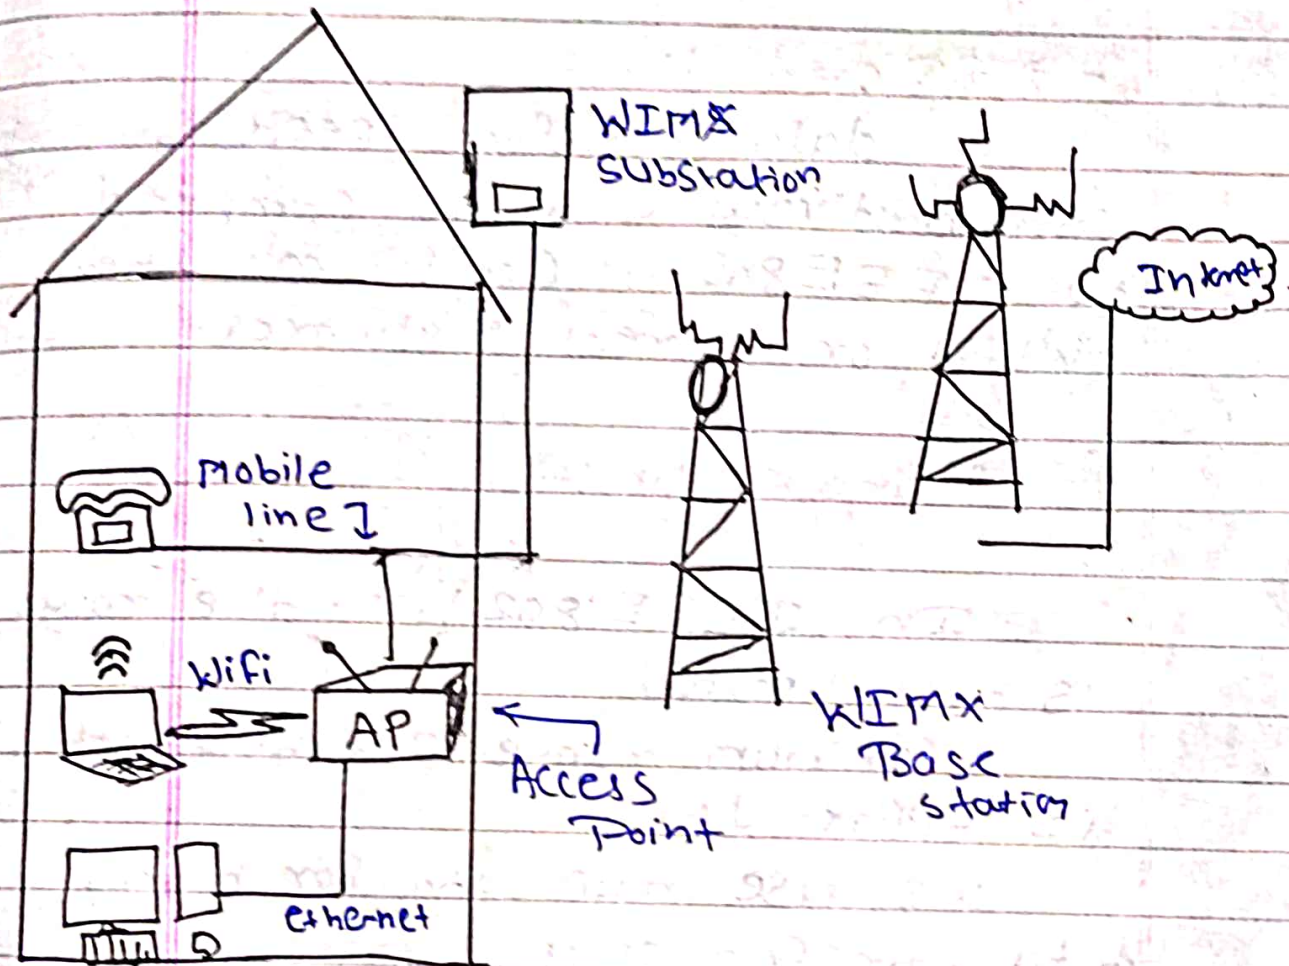

Fig Architecture of WIMAX

W: world wide  
 I: interoperability for  
 M: microwave  
 A: access  
 X:

## • limitations of Bluetooth.

### → Speed limit

data transfer speed is comparatively slow as compared to IEEE 802.11 (wifi) or other WLAN or wired Networks.

### → Range limit

In IEEE 802.15.1 the range is also limited.

Maximum range for bluetooth is approx. 10m.

we use bluetooth for nearby data transfer only

### → Bandwidth limit

Bluetooth devices has limited small bandwidth.

## • Applications

- headset
- sound & speakers
- remote
- sensors.
- Laptop / mobiles.
- MP3 players etc.
